Intern Assessment PRD — AI-Generated SaaS Comparison Page

Task: build, from scratch in your own project, a tool that turns a typed software keyword into a full comparison page.

1. Overview

- **Product:** an AI assistant that answers a keyword with an interactive page instead of a chat reply.
- **Problem:** small teams pick software (CRM, payroll, video calls) without knowing the real cost per seat, the free-plan limits or how vendors compare.
- **Goal:** one keyword, e.g. "CRM software" or "zoom pricing", produces a page that answers *which tool should my team pick, and what will it really cost?*
- **You build:** the page generator and the SaaS page with its 8 subcategories. A loan page built the same way is given as the design reference (section 3).

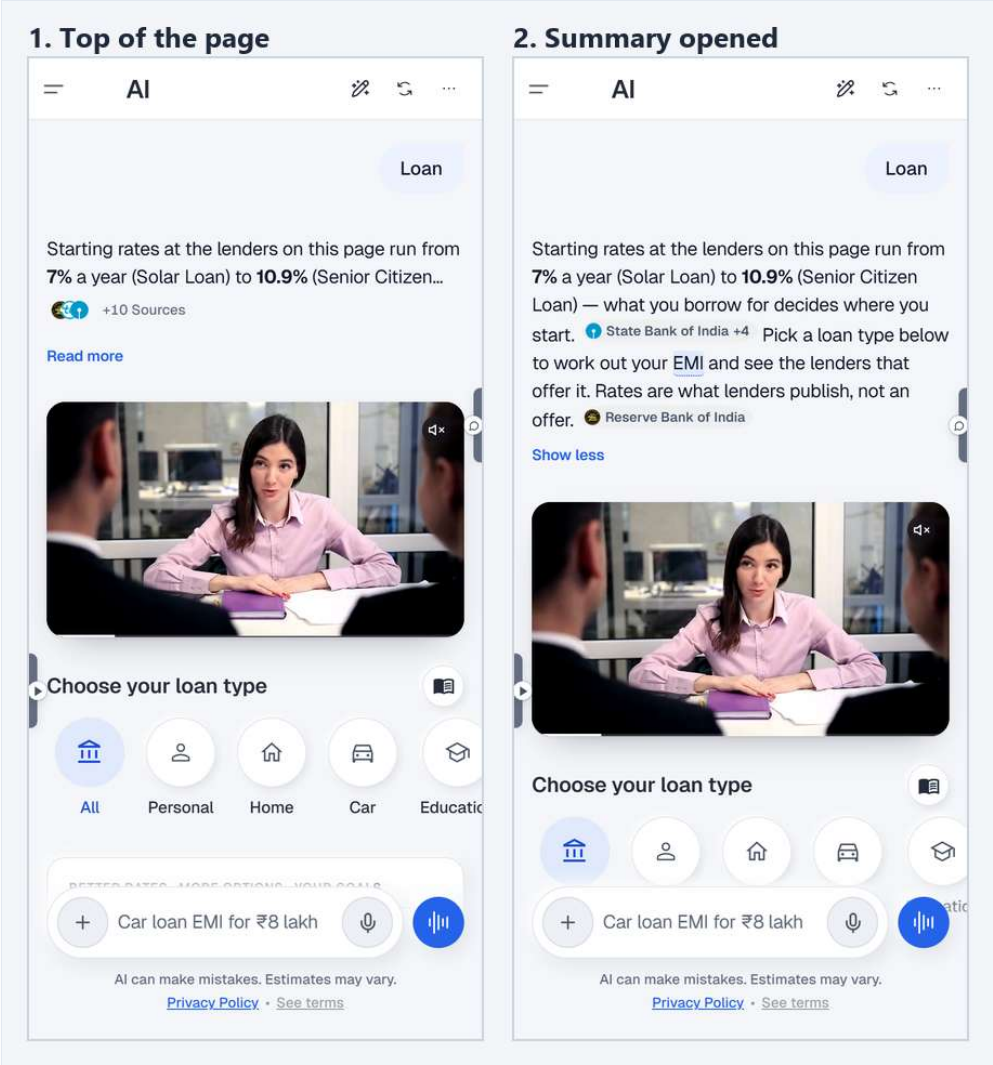

2. How page generation works

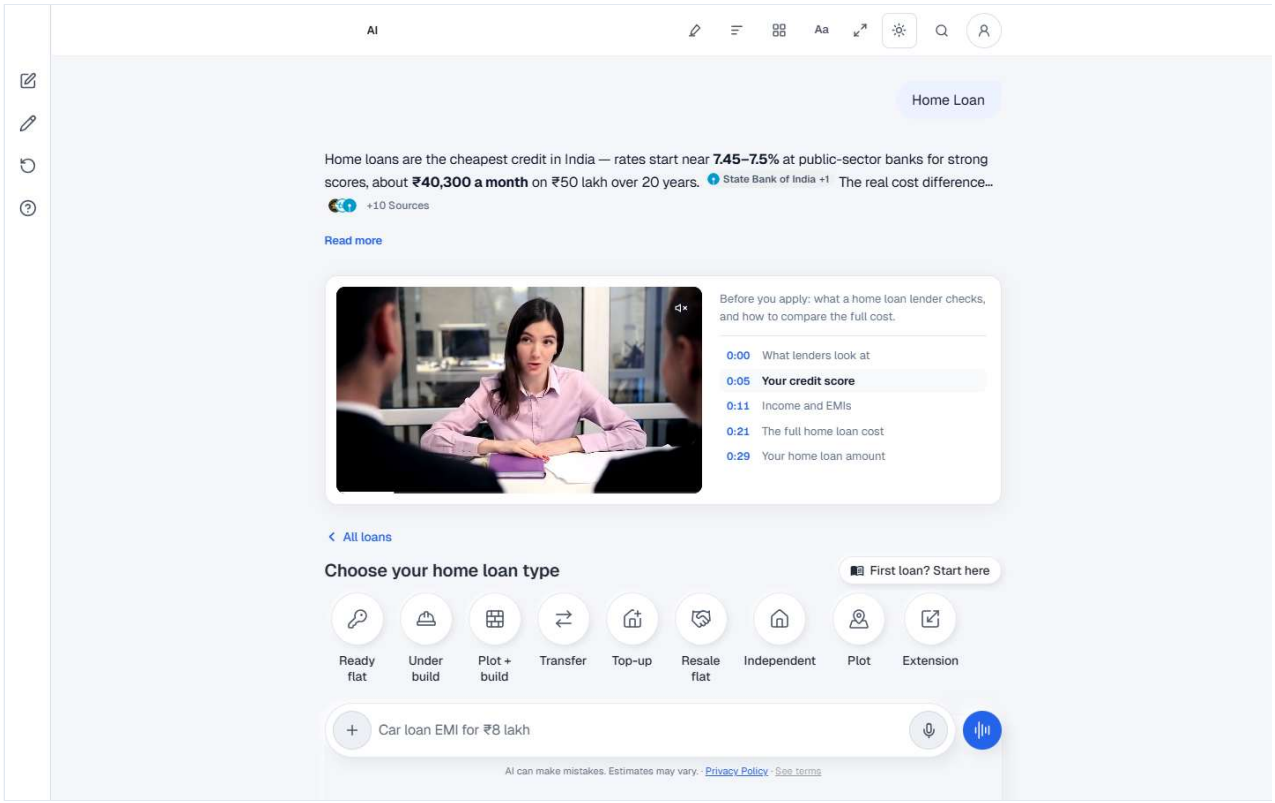

- **Input:** one text box. The page URL carries the keyword, e.g. `/page?q=zoom+pricing`, so any page can be shared and reloaded.
- **Matching:** the keyword maps to the SaaS category and one of its 8 subcategories. Unknown keywords fall back to the SaaS **All** view.
- **Content:** each subcategory's words, vendors, prices and sources live in a JSON file. The page is rendered only from that JSON; no text is hard-coded in components.
- **AI (bonus):** an LLM may write the summary or answer free-text questions, but every price shown must still come from the JSON.

3. Reference design: a loan page

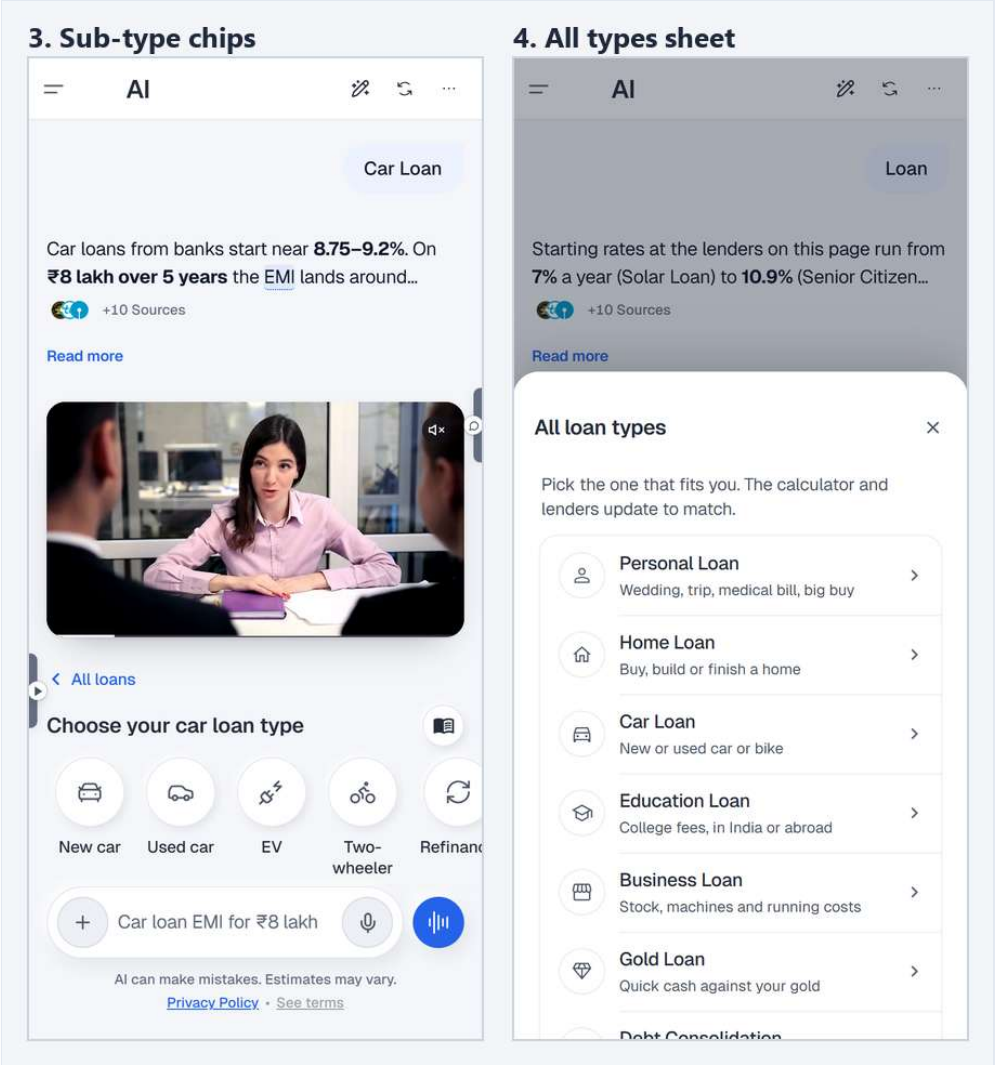

The screenshots show a loan page built the same way. Copy its structure and behaviour, not its content. Your SaaS page needs the same blocks.

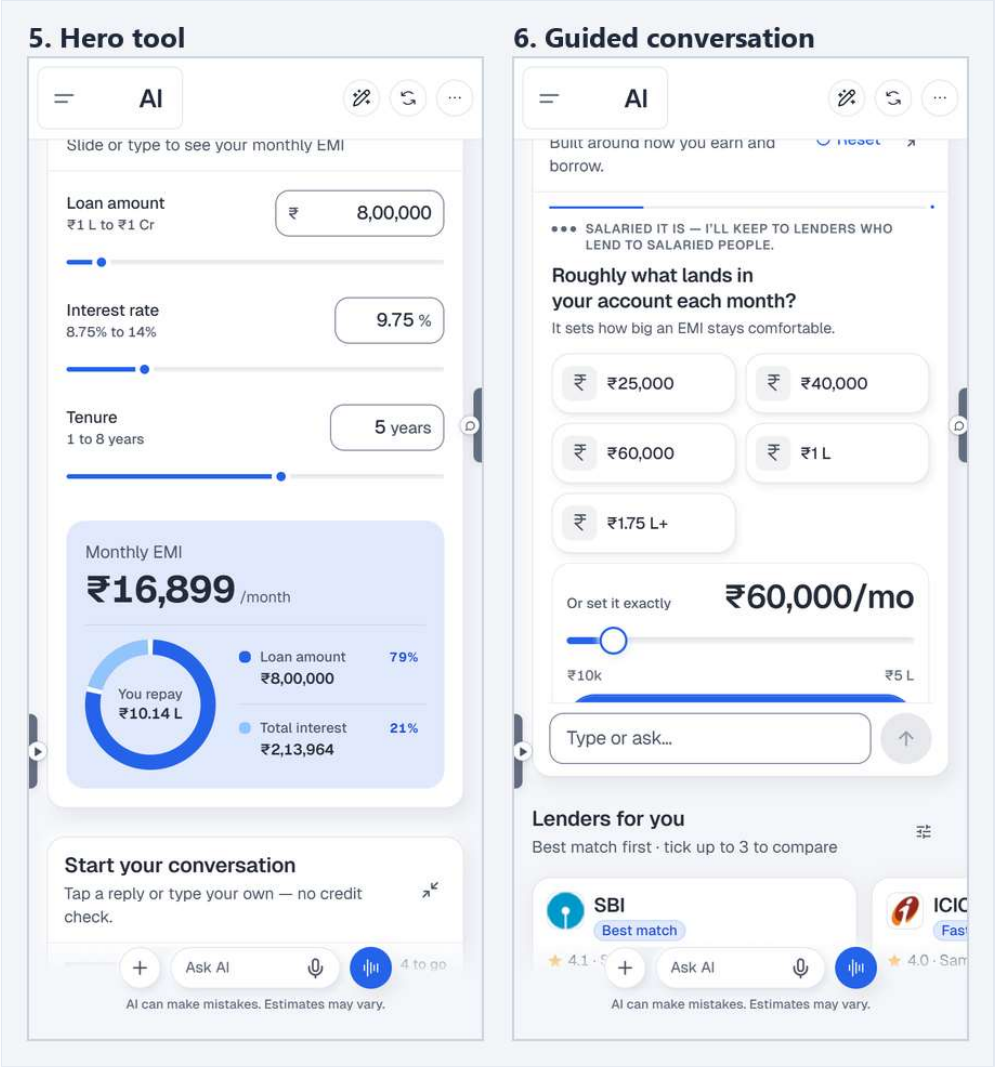

- **Query bubble:** the typed words, top right; tap to edit and regenerate.
- **Summary:** 2–3 sentences with real numbers; "Read more" shows inline source chips.
- **Sources row:** logos of the sites the numbers came from.
- **Video section:** muted explainer with a progress bar.
- **Type chips:** All + each type.
- **Search bar:** always on screen at the bottom; its example text fits the current type.

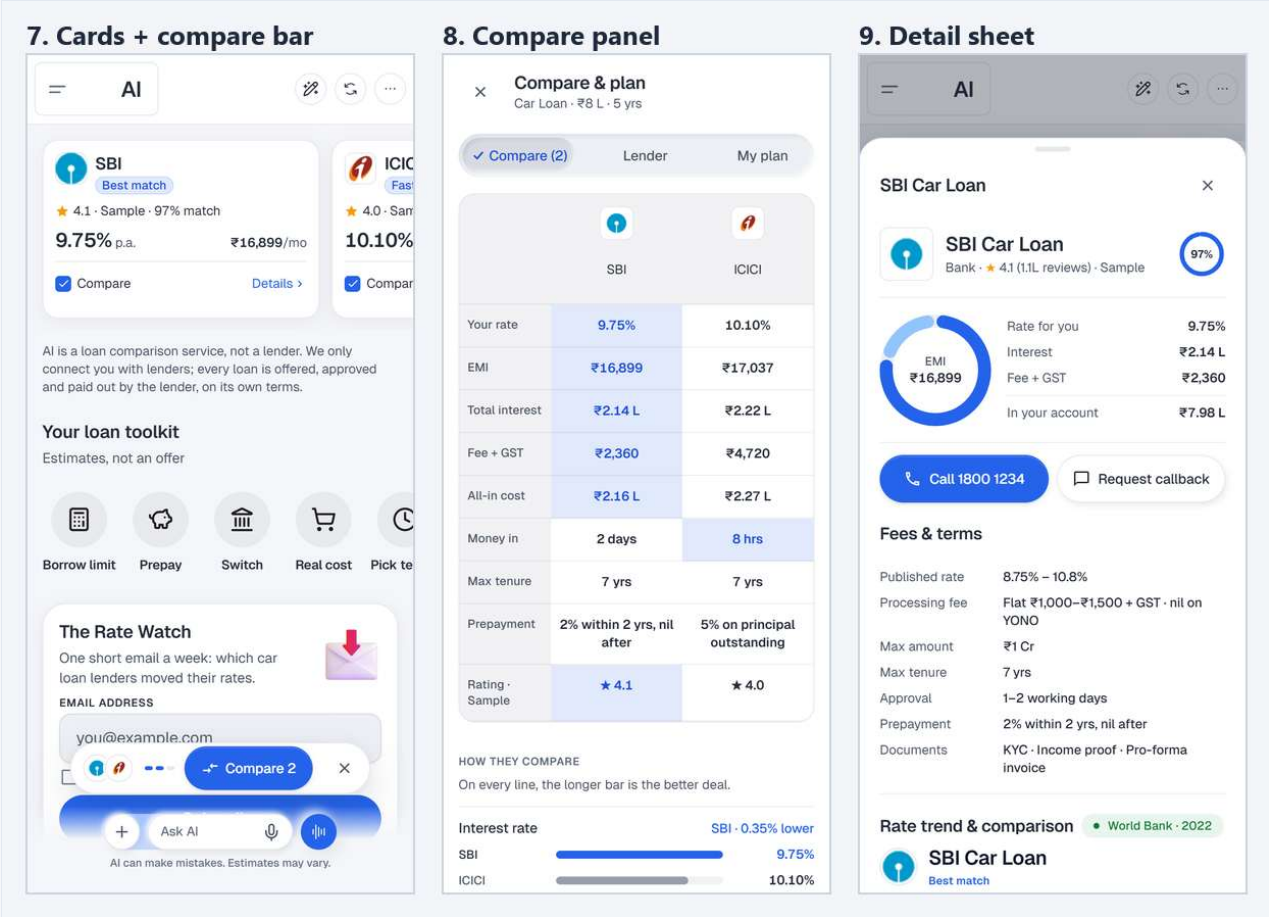

Desktop: same blocks in one centred column; video chapters beside the player.

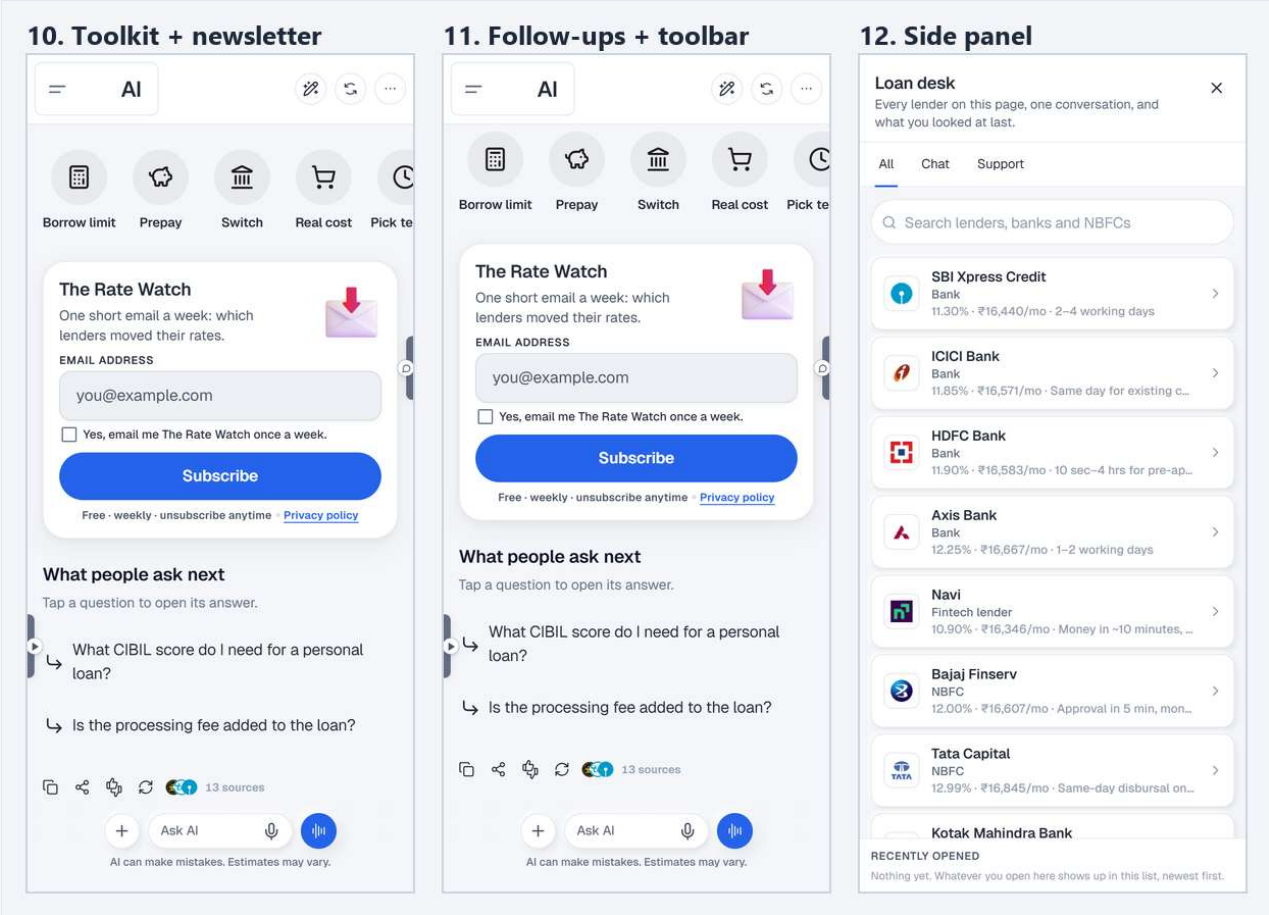

Picking a type swaps the chips for its sub-types, with a back link. "See all" opens a sheet of every type.

- **Hero tool:** one calculator answering the main question.
- **Guided conversation:** 4 tap-to-answer questions; each answer re-ranks the cards.

Cards scroll sideways with a Compare tick; 2–3 ticks open a compare panel with the better value highlighted; Details opens a sheet with the user's own numbers and terms.

Small extra tools, a newsletter with a consent tick, follow-up questions, an answer toolbar (copy, share, rate) and a side panel listing every provider.

4. Functional requirements

Build the blocks top to bottom in this order.

ID	Block	Requirement	Priority
FR-1	Query bubble	Shows the typed words; editing it regenerates the page	Must
FR-2	Summary	Price range per user a month, cut at 2 lines with Read more, inline source chips	Must
FR-3	Sources row	Vendor pricing pages, each with the date checked	Must
FR-4	Video section	"How SaaS pricing works" explainer, muted autoplay, chapters on desktop; poster image if no clip	Must
FR-5	Subcategory chips	All + the 8 subcategories (section 5)	Must
FR-6	Sub-type chips	Each subcategory's own sub-types, with a back link	Must
FR-7	Hero tool	Cost calculator: seats × plan × monthly or annual → cost a month, a year, and the annual saving	Must
FR-8	Guided conversation	4 questions: team size, budget per user, must-have feature, current tool; answers re-rank cards	Must

ID	Block	Requirement	Priority
FR-9	Result cards	Vendor logo, cheapest paid plan, free plan yes/no, badge, Compare tick, Details	Must
FR-10	Compare	2–3 vendors: price monthly and annual, cost for your seats, free-plan limit, contract; better value highlighted	Must
FR-11	Detail sheet	All tiers, hidden costs (onboarding, add-ons), link to the pricing page	Must
FR-12	Disclaimer	Not a reseller; list prices, date checked, taxes extra	Must
FR-13	Newsletter	"Price Watch" signup with a consent tick	Must
FR-14	Follow-ups + toolbar	3–5 questions per subcategory; copy, share, rate	Must
FR-15	Search bar	Fixed at the bottom; example text changes per subcategory	Must
FR-16	Desktop	Same blocks; compare panel as a right rail	Must
FR-17	Toolkit	2+ small tools: annual vs monthly, unused seats, renewal rise	Bonus
FR-18	Side panel	Searchable list of every vendor	Bonus
FR-19	India prices	`&loc=IN` shows INR, or says billing is in USD	Bonus

5. Subcategories

Subcategory	Keywords that open it	Vendors to cover	Sub-type chips (suggested)
CRM Software	crm software, salesforce pricing, zoho crm	Salesforce, Pipedrive, Zoho CRM, Freshsales	Small team, Sales pipeline, Free plan, Enterprise
Project Management	project management tool, asana pricing, jira pricing	Asana, monday.com, ClickUp, Jira, Trello	Kanban, Software teams, Agencies, Free plan
Accounting	accounting software, quickbooks pricing, tallyprime	QuickBooks, Xero, FreshBooks, Zoho Books, TallyPrime	Freelancers, Small business, GST invoicing, Inventory
HR & Payroll	payroll software, hris software, gusto pricing	Gusto, Rippling, Keka, greytHR	Payroll only, Full HR suite, India payroll, Contractors
Team Collaboration	team chat app, slack vs teams	Slack, Microsoft Teams	Chat, Docs and wikis, Whiteboards
Video Conferencing	video conferencing, zoom pricing, google meet pricing	Zoom, Webex, Google Meet, GoTo Meeting	Meetings, Webinars, Free plan limits

Subcategory	Keywords that open it	Vendors to cover	Sub-type chips (suggested)
Analytics	product analytics, power bi pricing, mixpanel pricing	Mixpanel, Amplitude, Power BI, Tableau	Product analytics, BI dashboards, Web analytics
Reviews & Comparisons	software reviews, g2 reviews, capterra	G2, Capterra, TrustRadius	Review sites, Head-to-head, How to read reviews

You may change the sub-types; explain why in your write-up.

How they must behave:

1. "saas" or an unknown keyword opens **All**: chips = All + the 8, one top pick per subcategory. Never an error page.
2. A subcategory keyword opens with its chip selected, its sub-type chips and an **All software** back link (screenshot 3).
3. Tapping a chip switches in place without a reload; the URL updates and Back works.
4. Everything below the chips follows the selected chip.
5. **See all** opens a sheet of the 8 with one line each (screenshot 4).
6. Keywords match as phrases, not single words ("hris" must not match "christmas"). A unit test covers every keyword above.

6. Non-functional requirements

- **Data honesty:** no invented prices, ratings or reviews. Every number links to its source; a missing price is left out, never guessed. Estimates are labelled "Estimate".
- **Responsive:** works at 320, 375, 768 and 1280 px and in phone landscape. No sideways scroll, no clipped text.
- **Theming:** light and dark mode, colours from one set of design tokens.
- **Performance:** first content within 2 seconds on a mid-range phone; a skeleton shows while loading.
- **Accessibility:** keyboard reachable, visible focus, labels on every input and icon button.
- **Stack:** your choice; React or Next.js recommended. Code in a public Git repository.

Out of scope: user accounts, payments, a real email backend (the newsletter can stop at a success message), and an admin panel.

7. Deliverables

Hand in:

☐ Public repository link and a live deployed URL

☐ README: how to run, folder structure, how to add a new subcategory

☐ Screenshots of All, CRM and Accounting at 375 px and 1280 px, plus dark mode

☐ One-page write-up: what you built, what you skipped and why, and every source used with the date checked
